*Of course, this advert is not describing some miracle
new cure-all wonder drug but rather the proven
benefits of a full night of SLEEP...*

And it is completely FREE!

Did you know...

Humans spend a third of their lives asleep, so if you live to the grand old age of 90 you will spend about 30 years sleeping!

Did you know...

The record for the longest period with no sleep is 11 days and pain tolerance is reduced by sleep deprivation!

Did you know...

The sensation of falling when half-asleep and jerking yourself awake is called hypnic jerks.

Did you know...

Fear is not normally the main emotion in nightmares, usually sadness or guilt.

Did you know...

It's thought that around 15% of people are sleepwalkers.

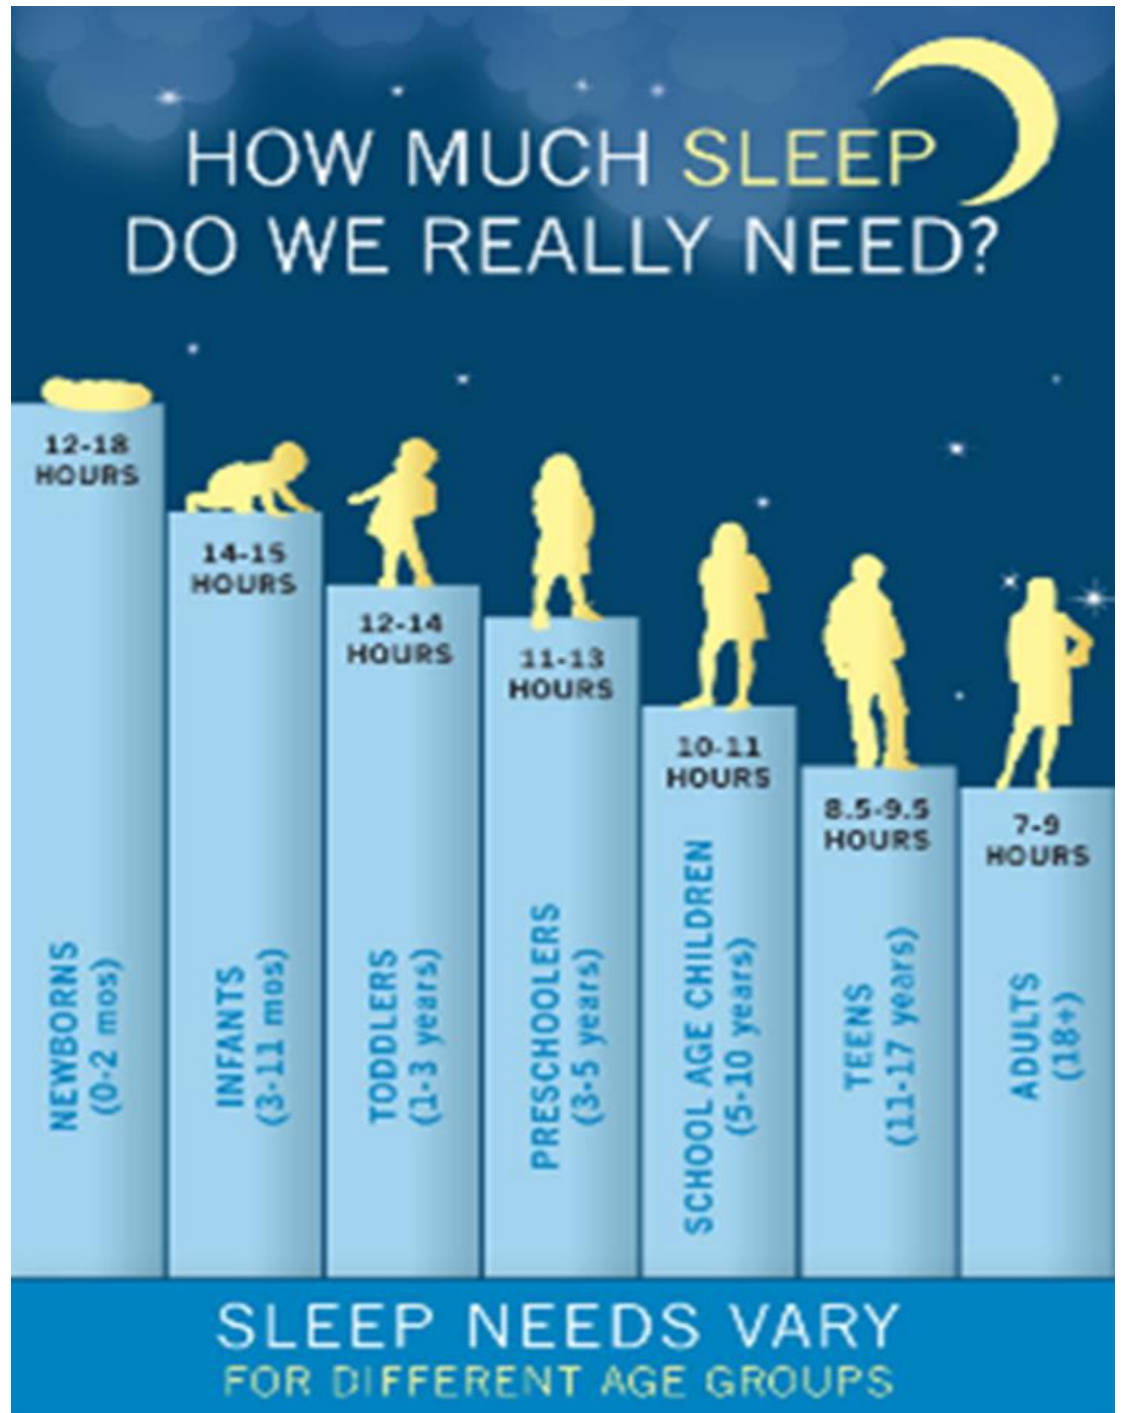

Are we getting enough sleep?

It is recommended that teenagers need 8-10 hours of sleep a night.

Adults need about 8.

If you are worried you are not getting enough, don't worry, we have top tips for sleep coming up!

Circadian Rhythms

If you've ever noticed that you tend to feel energized and drowsy around the same times every day, you have your circadian rhythm to thank! Our biological rhythms are tied to sunlight and darkness which sends signals to our brains to tell us to either go to sleep or wake up! Circadian rhythms also affect other things like mental alertness, physical strength, body temperature and pain sensitivity!

What do you think can get in the way of this process in terms of melatonin not being released due to too much light?

Sleep Chronotypes

Some individuals feel more alert earlier in the morning and tired earlier at night whereas others may feel alert later in the day.

*This difference appears to be mostly biological (influenced by genetics). In sleep research, this biological difference is called a **chronotype** and early risers are referred to as 'larks' while the late risers tend to be called 'night owls'.*

*What do you think you are? Try the quiz

Teenage Chronotypes

Teenagers need more sleep than adults, because of their biological rhythms, they naturally like to go to sleep later and get up later, they have an evening chronotype, so they are more likely to be 'night owls'

So they are not always being lazy when they want a lie in at the weekend, their body clocks are wired to want this!

Wake up feeling fresh!

Have you ever noticed that sometimes you wake up and you feel fresh, ready to start your day, while on other days you feel really groggy and you would pay a lot of money to have another half hour in bed? This is all down to at what stage of your sleep cycle you wake up during!

People are at their freshest when they wake up at the end of a sleep cycle. A sleep cycle will last 90 minutes...let's find out how to wake feeling great...

WHEN TO FALL ASLEEP – THE 90 MINUTE RULE

If 9 hours of sleep is required for sleep and you want to get up at 8am, work back 90 minute blocks... you should aim to be asleep as close to 11pm as possible.

Why we should take sleep seriously

Positives :

- *Concentration*
- *Attention*
- *Decision making*
- *Creativity*
- *Social skills*
- *Health – physical and mental (dementia)*

Negatives:

Mood changes
Stress
Anger
Impulsivity
Drink & Smoke

TOP SLEEP TIPS...

SLEEP TIPS – PUT THE SCREENS AWAY

- Stay off electronic devices close to sleep. Around 1 hour before you want to fall asleep.
- The blue light emitted from the screen will trick the brain into stopping the release of the sleep hormone melatonin and delay sleep.
- The stimulation from devices will also make it hard for your brain to 'switch off'

If you must use them for a short time, then use 'night shift' mode. You can access this through the settings – display & brightness section of your phone. This reduces the blue light. Not using them at all is better!

SLEEP TIPS

- Have a regular wake and bed time – this allows the internal body clock to get into a pattern.
- Try not to change your routine too much at the weekend

SLEEP TIPS

Avoid caffeine after lunch.

Caffeine stays in your body for up to 6 hours and keeps you awake.

SLEEP TIPS

Avoid eating close to bed time – up to two hours before and avoid sugary/ spicy snacks close to bed time.

SLEEP TIPS

Avoid napping during the day for longer than 40 mins otherwise you will disrupt your night time sleep.

SLEEP TIPS

Keep your bedroom cool and dark. Try to stick to a good sleep routine e.g. warm bath, brush teeth, soothing music, breathing exercises, unwind...stick to this and you should see an improvement in sleep.

SLEEP TIPS

If you are struggling to fall asleep
try to keep your eyes open and stay awake.
Oddly, attempting to stay awake is surprisingly
tiring and helps you fall asleep.

SLEEP TIPS

Your behaviour influences how you feel.

For instance, smiling makes you feel happy, and forcing your face into a frown makes you feel sad.

The same is true of sleep. Fool your body into thinking that you are tired by letting your eyes droop, your arms and legs feel heavy, and even faking a yawn or two.

EAT TO SLEEP?

- Cherries and many nuts like almonds contain natural melatonin (the hormone that helps kick start sleep) so eating cherries or drinking cherry juice before bed may just help you fall asleep.
- Milk and other dairy products such as yoghurt contain an amino acid called tryptophan which studies have shown helps to increase melatonin. That's why a warm glass of milk is often used as a sleep aid.

Discuss any ideas that you
feel like you might give a go
to get better sleep

At this moment in time our
health and looking after
ourselves has never been so
important. Starting with a good
night's sleep is a really fantastic
foundation for a healthy life!

Sweet dreams!
